

CS110 HTML/CSS Project

Overview

This comprehensive project guides you through creating a professional, semantic, and visually appealing HTML resume/AboutMe page. Starting with fundamental HTML structure, you'll progressively enhance your page by adding interactive elements and custom CSS styling. The project emphasizes semantic HTML, accessibility, clean code principles, and the separation of content from presentation.

Objectives

- Create a structured resume using semantic HTML
 - Implement proper document hierarchy
 - Add interactive elements, including images, lists, and hyperlinks
 - Create and apply external CSS styling
 - Practice proper organization of HTML and CSS files
 - Follow clean code and web design best practices
-

Part 1: Semantic HTML Foundation

Document Structure Requirements

Your HTML resume should include the following foundational sections:

1. Document Type and Language Declaration

- Use `<!DOCTYPE html>` and `<html lang="en">`
- These elements define the document as HTML5 and specify English as the content language

2. Metadata and Page Title

- Use `<head>`, `<meta>`, and `<title>` tags
- Include proper character encoding and viewport settings
- Set an appropriate title for the browser tab

3. Header Section

- Use `<header>`, `<h1>`, `<hr>`, and `<p>` tags
- Include your name as the main heading
- List contact information (email, phone, etc.)

4. Personal Information Section

- Use `<section>`, `<h2>`, and `<p>` tags
- Include a brief introduction about yourself

5. Education Section

- Use `<section>`, `<h2>`, and `<p>` tags
- Describe your educational background

6. Skills Section

- Use `<section>`, `<h2>`, `<h3>`, and `<p>` tags
- Divide skills into categories (e.g., Technical Skills, Soft Skills) - List your abilities in a clear, readable format

7. Footer Section

- Use `<footer>` and appropriate tags within
- Include copyright information or additional notes if applicable

Semantic HTML Best Practices

- Use appropriate HTML5 semantic elements (`<header>`, `<section>`, `<footer>`, etc.)
- Create a logical heading hierarchy (`<h1>` through `<h6>`)
- Use `<p>` tags for paragraphs and descriptive text
- Ensure proper nesting of elements

Part 2: Enhanced HTML Elements

Add these HTML structures to enhance your foundational structure:

Required Elements:

- `<img>` - Profile images
- `<ul>` and `<li>` - Unordered lists
- `<a>` - Hyperlinks

Feel free to explore demos for inspiration. You're welcome to use any styles shown and incorporate them into your project. Let your creativity shine and design it in your own unique way!

Implementation Recommendations:

1. Profile Image

- Add a professional profile image using the `<img>` tag - Include appropriate alt text for accessibility
- Position the image appropriately in your header section

2. Convert Skills to Lists

- Transform your skills sections into proper unordered lists (`<ul>` and `<li>`)
- Ensure proper nesting and structure
- Organize technical skills and soft skills as separate lists

3. Add Hyperlinks

- Convert your contact information into clickable links using the `<a>` tag
- Link your email (mailto:), phone (tel:), and social media profiles
- Ensure all links have appropriate attributes (href, title, etc.)

4. Additional Information Section (optional)

- Create a new section with an ordered list (`<ol>` and `<li>`) for projects, work experience, or achievements
- Implement proper list structure and formatting

Part 3: External CSS Styling

File Organization

1. Create External CSS File

- Create an external CSS file named `styles.css`
- Link it properly to your HTML document using the `<link>` tag in the `<head>` section

Stylesheet Requirements:

2. Background Styling

- Add a background image using the pseudo-element `body:before` with transparency
- Ensure the background doesn't interfere with content readability

3. Consistent Element Styling

- Implement a cohesive color scheme throughout the page
 - Style sections, headings, paragraphs, and lists consistently
 - Add appropriate padding, margins, and spacing
-

Clean Code Principles

- Maintain a logical structure with proper indentation
 - Keep the code simple and readable
 - Focus on document structure rather than presentation
 - Separate content (HTML) from presentation (CSS)
-

Deliverables

1. HTML file (`index.html`) with all required sections and enhanced structure
 2. CSS file (`styles.css`) with all required styling
 3. Your profile picture and any background images used
-

Why This Project Matters

Semantic HTML ensures:

- **Accessibility:** Helps screen readers and assistive technologies navigate the page
- **SEO:** Improves search engine visibility
- **Maintainability:** Makes code easier to read and update
- **Futureproofing:** Ensures compatibility with evolving web standards

This comprehensive project teaches you:

- Proper integration of media content
- Interactive elements via hyperlinks
- Structured information presentation with lists
- Separation of content (HTML) and presentation (CSS)

- The importance of consistent styling in user experience

These skills form the foundation of modern web development and will be essential for all future web projects.
